Page two under the instrument specification: the verdict

Generated by `scripts/instrument.py` from `reports/summary/grid.json` (cycle `scan_2026-10-07_composite_d`) and the instrument entries, under DN-015 §5 (page two shows only `specified` checks) and §6 (the cell has four states). `SUMMARY.pdf` is not rebuilt here; the rebuild is a follow-on task, registered after the operator reads this verdict.

Which checks may appear

Check	Plain name (what a pass asserts)	State	On page two
A1	Page links a structured data file	specified	yes
A2	OpenAPI description served at the recorded API address	invalid	no
A3	Page links an archive or large unfiltered file	specified	yes
A4	robots.txt permits eight listed crawler tokens	invalid (declaration)	no
A5	The site's sitemap lists the data page	specified	yes
A6	Page markup declares a named, described dataset	invalid	no
A8	Markup dates the data; a latest-version link resolves	project_defined	no
A9	A probed machine address returns non-HTML content	project_defined	no
A10	Data tool answers with real status and content	project_defined	no
B3	Page links a methodology readable as text	project_defined	no
D1	Page or API terms name a recognised licence	project_defined	no
D4	Agency's data.json inventory lists this page, validly	specified	yes
F4	Change history served as a structured feed	project_defined	no

4 of the grid's 13 checks are `specified` and may appear: A1, A3, A5, D4. 9 come off: A2 (invalid); A4 (invalid); A6 (invalid); A8 (project_defined); A9 (project_defined); A10 (project_defined); B3 (project_defined); D1 (project_defined); F4 (project_defined).

How many of the cells change state

Under DN-015 §6 a page the harness could not measure is no longer a fail. Of the 208 cells (16 agencies by 13 checks), **86 change state** and **86 become "could not measure"**.

v3 state	four-state	cells
fail	could not measure	81
fail	fail	83

v3 state	four-state	cells
partial	could not measure	5
pass	pass	39

Why the pages behind those cells were not measured (pages, not cells):

class	pages
access denial	48
unconfirmed absence	40
robots kept scanner out	22

Where the "could not measure" cells concentrate, by agency (of 13 checks each):

agency	cells
Bureau of Labor Statistics	13
Office of Research, Evaluation, and Statistics	13
Bureau of Transportation Statistics	12
Energy Information Administration	7
National Agricultural Statistics Service	7
Bureau of Economic Analysis	6
Economic Research Service	5
Substance Abuse and Mental Health Services Administration, Center for Behavioral Health Statistics and Quality	4
Bureau of the Census	3
National Animal Health Monitoring System, Animal and Plant Health Inspection Service	3
National Center for Education Statistics	3
National Center for Health Statistics	3
Statistics of Income	3
Bureau of Justice Statistics	2

agency	cells
Division of Research and Statistics, Microeconomic Surveys Unit	1
National Center for Science and Engineering Statistics	1

And by check:

check	cells
A1	14
A3	13
A9	11
D4	11
A2	7
D1	5
A6	4
A8	4
B3	4
F4	4
A4	3
A5	3
A10	3

Page two after both rules

With only the 4 `specified` columns kept, page two would hold 64 cells: could not measure 41, fail 15, pass 8.

Cells that rested on a project-defined branch

For each grid check, how many measured pages (pass or fail) were decided by a branch in each state; a page decided by a `project_defined` or `invalid` branch carries no published claim.

check	pages by branch state
A1	specified 4
A2	project_defined 13
A3	specified 6

check	pages by branch state
A4	invalid 1, specified 12
A5	specified 13
A6	specified 19
A8	specified 19
A9	project_defined 8
A10	project_defined 12, specified 1
B3	project_defined 7, specified 12
D1	project_defined 3, specified 13
D4	specified 7
F4	project_defined 9, specified 9
