Infrastructure

AI readiness heavily depends on a solid infrastructure, which includes powerful computing resources and networks that can scale. A strong security foundation is essential, as is ensuring the sustainability of the entire AI implementation.

How would you rate your organization's current IT infrastructure in terms of scalability and flexibility to accommodate the evolving computational needs of AI projects?

- ☐ Fully adaptable: can instantly accommodate any AI computational needs
- ☐ Highly scalable: designed with growth and future AI demands in mind
- ☐ Moderately scalable: can handle current projects but need enhancements for more complex applications
- ☐ Limited scalability: might need significant updates for large AI projects
- ☐ Not scalable at all

Does your organization have dedicated GPU resources available and integrated for processing of AI workloads?

- ☐ Robust GPU infrastructure available for current and future AI workloads
- ☐ Just enough GPU resources to cater to ongoing projects
- ☐ Limited GPU resources for experimental purposes only
- ☐ No, we don't have dedicated GPU resources available currently

How efficiently can your organization allocate compute resources for AI tasks based on their demand?

- ☐ Our systems are mostly automated and efficiently allocate resources based on AI demand
- ☐ We have some automated resource allocation processes, but manual intervention is often required
- ☐ Resource allocation for AI tasks is done manually and might not be optimal
- ☐ We do not have a structured approach to resource allocation for AI

How would you assess your current data center's network performance in terms of latency and throughput, especially for AI workloads?

- ☐ Optimal: minimal issues and tailored for the most demanding AI workloads
- ☐ Moderately optimal: rare hiccups with current workload, but will need improvement to cater to future demand
- ☐ Sub optimal: we have occasional latency issues, especially with large AI workloads
- ☐ Not optimal: we experience frequent issues and bottlenecks

As your AI projects grow in complexity and data volume, how prepared is your network to adapt to these accordingly?

- ☐ Fully flexible and adaptable: can accommodate any scale of AI projects instantly
- ☐ Highly scalable: designed with significant AI growth in mind
- ☐ Adequately scalable: might need periodic updates
- ☐ Somewhat scalable: potential bottlenecks for very large AI projects
- ☐ Not scalable: significant upgrades are required for large AI projects

How seamlessly is your network infrastructure integrated with your AI systems to facilitate efficient data flow and processing?

- ☐ High-level integration ensuring efficient data flow for most AI tasks, ensuring seamless operations across all AI projects
- ☐ Moderate integration: we've optimized major pathways but still have occasional hiccups
- ☐ Some basic integrations, but often require manual adjustments
- ☐ No integration: our network and AI systems operate mostly in silos

How would you assess your organization's awareness and understanding of cybersecurity threats specific to AI and machine learning systems?

- ☐ High awareness: have a comprehensive understanding and / or regularly update our security protocols based on new threats
- ☐ Moderate awareness: aware and have taken preliminary precautions
- ☐ Limited awareness: have some basic understanding but no specific measures in place
- ☐ Unaware of security threats specific to AI workloads

How does your organization ensure the protection of data utilized in AI models, especially during transit and at rest?

- ☐ End-to-end encryption with regular checks and security audits, continuous monitoring and instant threat response
- ☐ Advanced encryption measures in place, but may lack regular audits
- ☐ Basic encryption measures in place
- ☐ No specific encryption or protection measures

How equipped is your organization to detect and prevent unauthorized tampering or adversarial attacks on your AI models?

- ☐ Fully equipped: have proactive monitoring and tamper detection with timely counter measures
- ☐ Moderately equipped: have protective measures in place but lack real-time monitoring
- ☐ Somewhat equipped: we are aware of the risks and have basics sorted but lack robust measures
- ☐ Not equipped: have not considered the cybersecurity aspect of AI workloads

How does your organization manage access control to AI systems and datasets?

- ☐ Dynamic and granular access controls that adjust based on project needs and security levels, with real-time monitoring
- ☐ Advanced role-based access controls with periodic audits

- ☐ Basic role-based access in place but may lack regular updates
- ☐ Access is largely open and not specifically restricted

How ready is your company to deploy AI from a power consumption perspective?

- ☐ Highly prepared: we have dedicated infrastructure in place to optimize power consumption in AI deployment
- ☐ Somewhat prepared: some measures in place to address power consumption concerns in AI deployment
- ☐ Not prepared: no specific measures or considerations for power consumption in AI deployment
- ☐ Unsure
